

## Phone Modem vs Wireless?

Phone Modem and Wireless are two entirely different ways of sending messages to your LED Display. from your PC.

**Phone Modem Transmission** is sending the message through your phone line to the LED Display which is connected to a dedicated phone line. A dedicated phone line is required at the LED Display and this will incur a monthly phone bill for this line, which averages around \$25/mo.

**Wireless Transmission** is sending the message through a radio transmitter connected to your PC via the serial port to the radio transmitter in the LED Display. No phone line is required which means no phone bill. Wireless transmission is standard on all of ADSled's equipment.
